AutoCAD's rapid growth in the 1980s and 1990s was due in part to its ability to run at low cost. However, it is usually not feasible to make everything in a design program like AutoCAD. The more flexible a design program, the less likely you are to have a design that works from the first try. Therefore, all of the following points are worth considering when making a CAD decision. Selecting a CAD program for a design project depends on a number of factors, including: Your skill level with the chosen CAD program (e.g. AutoCAD or other software) The design needs of your project How quickly you need the design to be completed Your budget Your projected productivity Cost The one cost that you cannot avoid is the price of your chosen software. CAD programs range in price from hundreds to thousands of dollars. Price of CAD programs AutoCAD is priced at $4,095 (2019) for the standard, desktop model and $7,395 (2019) for the extended, professional level. Some of the programs with similar capabilities to AutoCAD, but which are more affordable, are listed below. All costs are for single-user licenses. For example, the total cost to purchase and support a license for SolidWorks is: Annual license cost is $2,000 Annual support contract is $1,000 Hardware required to support SolidWorks is approximately $3,500 Annual update license is $3,500 Annual hardware support contract is $1,000 Software features: SolidWorks AutoCAD has six key features that distinguish it from other CAD software: Drawings Drafting Actions Part-based modeling Import and export Raster images Drafting AutoCAD is the most popular drawing program in the world. Users create and update their drawings using the basic drawing commands that are found at the top of each drawing window. These include commands to move, resize, rotate, and split drawings, as well as commands to add objects, add lines, add and edit text, and create layers. AutoCAD's drawing commands The drawing commands that a user uses to create and update drawings are organized in the Tool Palettes, which are the main toolbars on the

command recognition and execution Although similar to many general purpose programming languages, AutoLISP is mainly focused on graphical programming, command recognition and execution. Users can write macros for a large number of tasks, which can be called from the user interface. Examples are: "draw a circle" or "create a copy of the file". Command recognition allows the programs to understand the user's intentions. It can also be used to programmatically control the application. Macros are easy to use, can contain a simple C-like programming language for control flow, and can use variables to refer to drawings.

The language is similar to Logo and similar to BASIC. There is a command interpreter, written in the same language, which runs on the application's desktop. Its response, usually a drawing or an object, is then displayed on the screen. The most common way of programming AutoLISP is by using the text editor which is shipped with AutoLISP. When creating a drawing, the user writes a.lsp file, which can be saved and restored at any time. The.lsp file is a script that the application reads in order to update itself, and then to update the screen. AutoLISP supports global variables. Local variables are available for use only in a few specific functions, such as commands. Global variables are declared outside of functions and accessed as shown below. (* start of global variable declaration *) (setq global-vars '((top-graf-txt-vars (LBL-tl-mnr "TEXT BOX")) (top-graf-lbl-vars (graf-lbl-fg (LBL-tl-mnr "GRAF LABEL")) (graf-lbl-attr a1d647c40b

Bloody Pit: Dark Ages Bloody Pit: Dark Ages is a 2000 American made-for-television horror film directed by David Schmoeller and starring Barry Corbin and Grant Show. It is the fourth and final installment of the Bloody Pit of Horror series, following the 1997 TV film Night of the Demons, the 1998 film Dead and Buried, and the 1999 film Dead and Deader: The Leslie Vernon Story. It premiered on Showtime on January 20, 2000. Plot In a way, all the films of the Bloody Pit of Horror trilogy converge at this final film. Yet the sequel is the one that most stands out from the rest because it serves as an origin story for Bruce Collins (played by Corbin), the character who appeared in the original film. This film begins with Bruce returning home after the events of the first film. While he is preparing to return to college, he is contacted by his former teacher Leslie Vernon (played by Jane Seymour), who explains that she has obtained information about an evil man called Gordon Drake (played by Garry Walberg). Once she has killed him, she is willing to meet with Bruce and return the prize. Now, this film begins to follow Bruce as he travels to the town of Peach Grove, Georgia, in order to meet Leslie. Once there, he is joined by a group of other students, including his roommate Jamie Keaton (played by Christian Kane), their sorority house leader Carly Proctor (played by Kelly Le Brock), and her boyfriend Scott Radnor
